Intro:

In my final project I was working on Food Panda app. This is a food delivery app and has a great UI. The UI simple and user friendly.

Overview of the visual elements, interactions, components

The elements of the UI of Food panda is attractive. The icons are represented properly according to their functionality. The images are properly placed and attractive for the users. The cooler combination is perfect and eye catchy. The colour combinations and the icons are matched with each others. The images and grids are perfectly placed. The illustrations are also great. The layouts of each elements are properly subjective. That's why user will not have hard experience to use the app. The animation of the app is simple but attractive and this will not be hampered by the device specification. So the user will have a smooth and easy experience to use it. The log in and sing up system is time efficient.

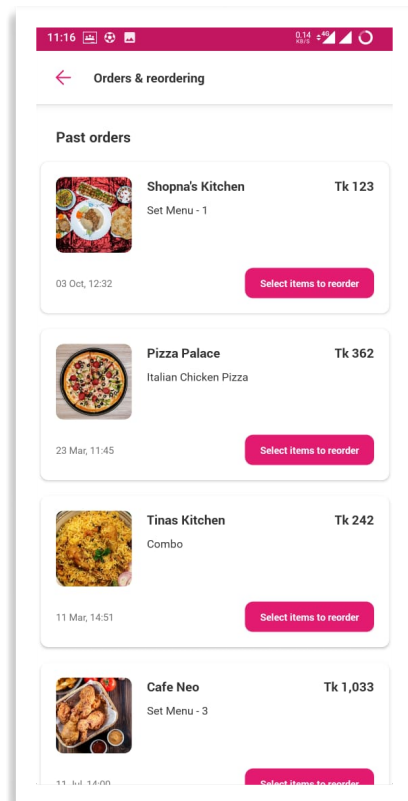

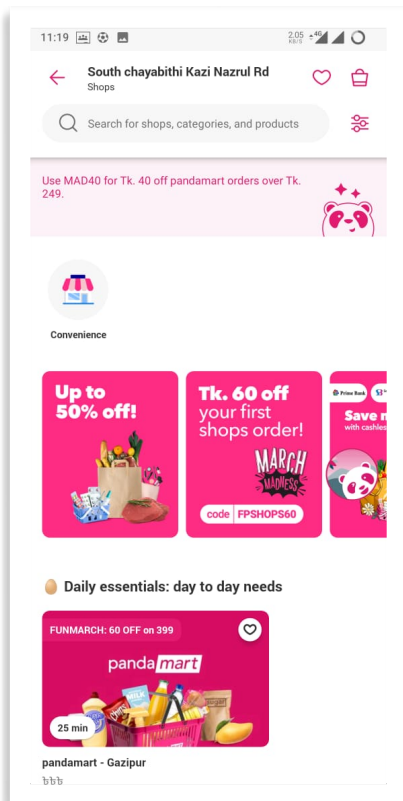

Fig:Stickers

The app is named after Panda. So the theme of the app is not appropriate. I mean, the colour of a panda and the app is not matched. A panda is white and black. But the app is totally red. So I think if the colour of the them the code is white and black, that will be more convenient. Only the black and white can not make the food delicious. So I think the out line of the each elements or convenient element can be red or yellow. That's way the app could be more attractive.
